

Action Plan for Platform Improvement

This document outlines the immediate and near-term action plan for improving the platform based on the feedback received from beta testers.

Immediate Priorities

The following high-priority items have been identified and addressed:

- **Improve Model Response Speed:** (Done) This was a recurring theme in the feedback, and improvements have already been implemented to enhance the speed and responsiveness of the model.
- **Enhance User Interface (UI):** (Done) Feedback indicated a desire for a more personalized and engaging UI. Initial enhancements have been made to address this.

Next Priorities

The following items are the next set of priorities to be addressed in the upcoming development cycles:

Priority	Action Item	Justification from Feedback
1	Refine User Persona Granularity	A user suggested that personas could be more granular to better fit personalities that fall in between the current options. This will improve the accuracy of the personalization algorithm.
2	Optimize Module Length	Feedback indicated that some modules were too long to complete in a single session. We will review and revise the content to create more digestible learning modules.
3	Expand Language Support	A user suggested expanding to other Cardano programming languages. We will begin research and development to incorporate

		more languages into the platform.
4	Personalized UI Effects	Building on the initial UI enhancements, we will explore and implement personalized UI effects to create a more engaging and customized user experience, as suggested by a tester.

Future Considerations

While the above items are the immediate and near-term focus, the following suggestions from the feedback will be considered for the long-term roadmap:

- Continuous performance monitoring and improvement.
- Expansion into a wider range of content and learning formats.
